

Internet Image Importer

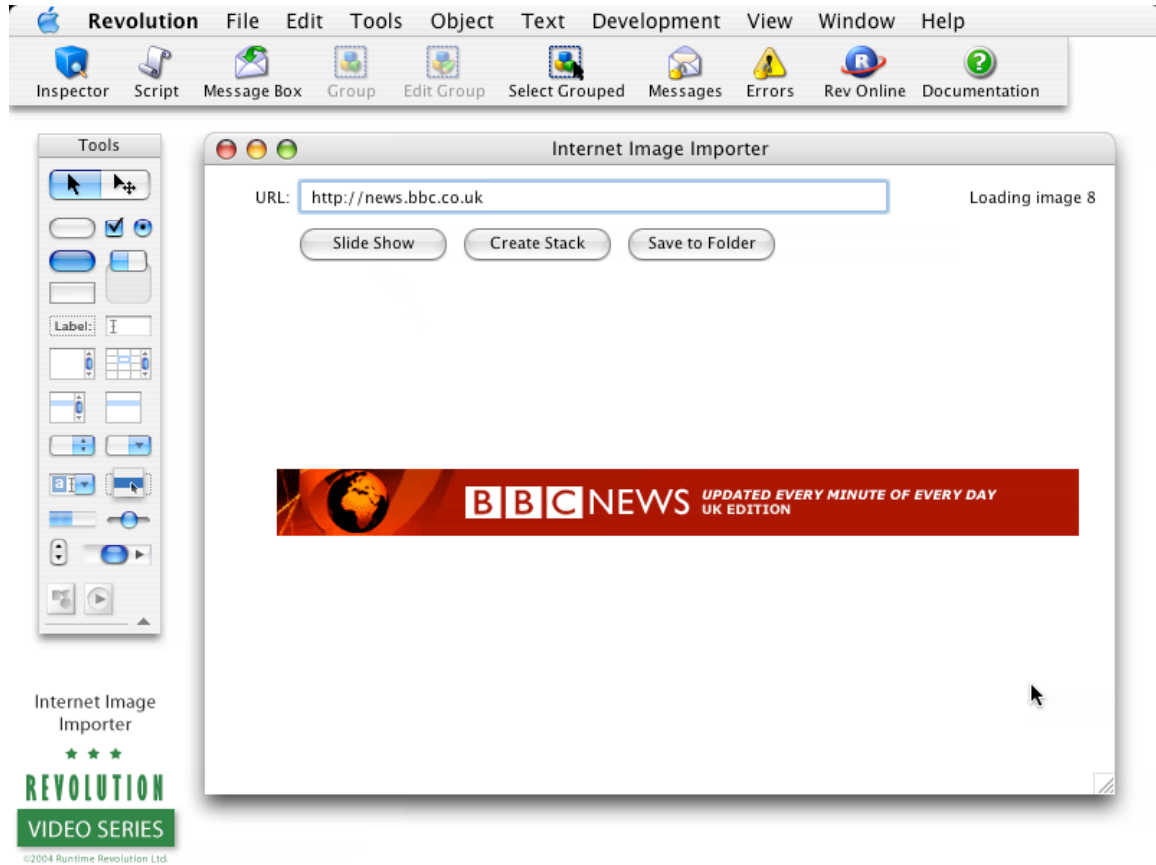

Importing all the images from a web page.

Internet Image Importer is a simple script which allows you to load the images from a webpage. This Video Tutorial shows you how to use this Sample Project, and how to take it apart to understand how it works or copy portions of it for use in your own applications. We recommend that you have explored the introductory video tutorials so you have a basic understanding of how Revolution works before you start on the Sample Projects.

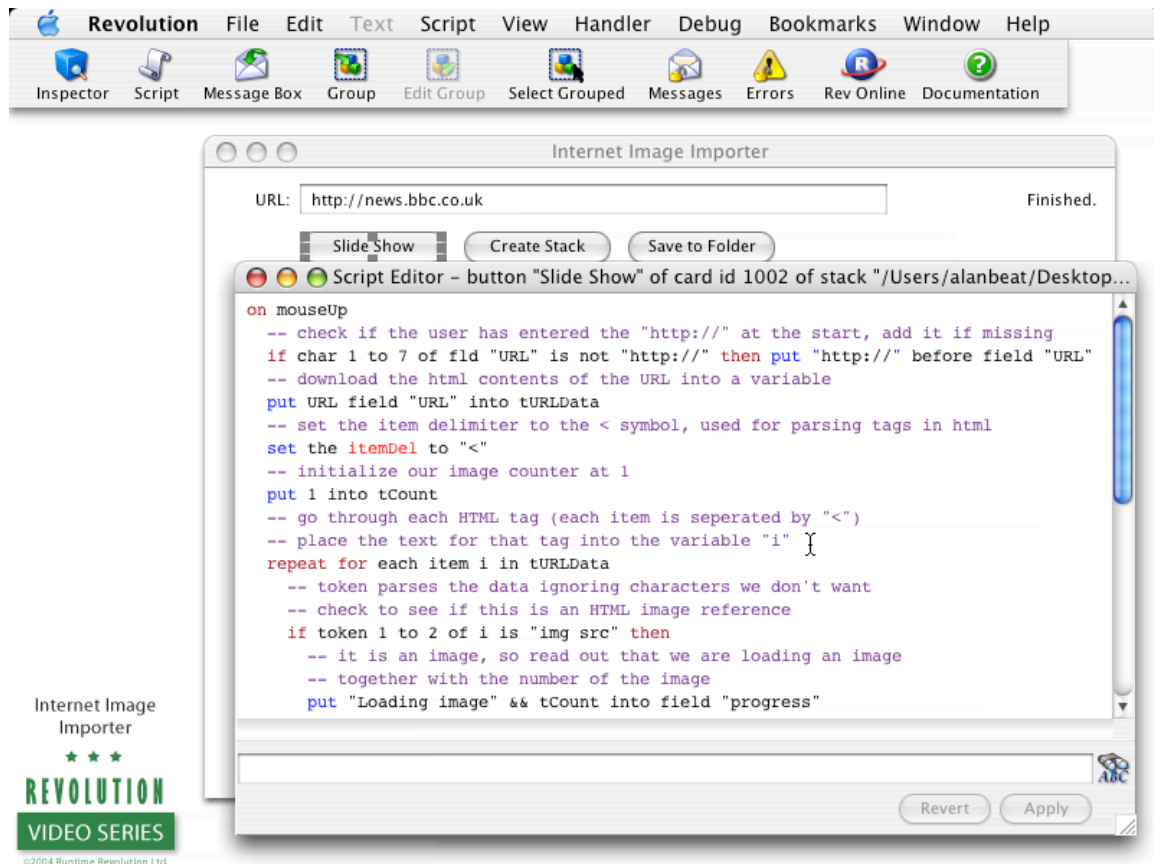

Key topics covered in this tutorial

- A walk through the Image Importer sample application
 - Laying out and editing the Importer interface
 - A look at the scripts of the importer
-

The interface for this application is very simple. Enter the URL and press slideshow. The images from the webpage will be displayed sequentially. Sometimes a very small image, for example, a placeholder that you can't see will be displayed. The other options in the stack allow you to load the images to a stack or save them to a directory of your choice.

All of the scripts in this application are contained within the objects on this card. For example, the slideshow button contains all the scripts necessary to do the entire slideshow.

As with all the sample projects lines colored purple are comments which explain how the script works.
