Using revGoURL to Make a mailto: Link

Put the email address in the field and make its style "Link". Lock the field.
Then put this script in the field:

```
on linkClicked pLink
  revGoURL "mailto:" & pLink
end linkClicked
```

If you want to add a default subject use:

```
revGoURL "mailto:" & pLink & "?subject=Very important stuff"
```

but this may not work with all emailers (although it shouldn't cause any problems).

Note that this script assumes that any linked text is an email address. If you have other links, you will need to check pLink first to see how you should handle it.
